MYTH BUSTING

4 physical security myths we still hear on NZ sites.

None are exotic risks. They're the ordinary ways good systems fail.

Swipe to bust them →

MYTH 1 OF 4

THE MYTH

~~More cameras means more security.~~

WHY IT FAILS

Coverage without monitoring or a response plan only records an incident. It doesn't stop one.

THE PRACTICAL FIX

Pair every camera with a monitoring or response plan.

Swipe for the next myth →

MYTH 2 OF 4

THE MYTH

~~A card system means only authorised people get in.~~

WHY IT FAILS

Tailgating, shared credentials and access left active for staff who have moved on.

THE PRACTICAL FIX

Audit credentials regularly. It matters as much as the hardware.

Swipe for the next myth →

MYTH 3 OF 4

THE MYTH

~~Once it's installed, it's done.~~

WHY IT FAILS

Batteries degrade, firmware ages, detectors get blocked by refits, and bypassed zones never get restored.

THE PRACTICAL FIX

Test it on a schedule. An untested system is one you're hoping works.

MYTH 4 OF 4

THE MYTH

~~Physical security is separate from IT.~~

WHY IT FAILS

Controllers, cameras and recorders sit on the network. If nobody owns patching and passwords, they're an entry point.

THE PRACTICAL FIX

Give every networked device an owner for patches and passwords.
